TITLE : TELETEXT RECEIVER

PH NL 030700	MAT. DOSSIER
-----------------	-----------------

ABSTRACT : PROBLEM TO BE SOLVED: To dispense with initializing of the recorded data, when a channel is switched to the desired one or the program to be stored in a prescribed register memory is changed by preparing a prescribed program-only register memory means, adding and recording the channel code of a receiving channel at the head of the prescribed teletext program data.

SOLUTION: When teletext program data are sent to a buffer memory 14 or a register memory and stored there, the channel code data showing the transmission channels are added to both program and page data heads and replaced with the oldest stored teletext program data. Thus, the teletext program of the channel that is inputted via a keyboard 16 and desired to be reproduced and displayed can be retrieved. Then it is possible to easily decide the teletext program of a desired channel even if there is mixture of existing teletext program data and newly recorded program data.
